

Float valve with balanced single seat Mod. ATHENA

This valve has been designed to complete the offer of solutions for tank regulation and control, which was restricted to the automatic control valves series XLC 400. Thanks to its exclusive technology ATHENA brings the concept of reliability and performance to the highest standards.

Technical features and benefits

- Body in GJS 500-7 with three ways, allowing the installation both with an angle or a globe pattern, containing an interchangeable sealing seat and piston in stainless steel and a sliding bush in bronze.
- Mobile block composed of the main shaft, obturator, gasket retainer and piston featuring a unique self-cleaning technology (pat. pending) to reduced the accumulation of dirt and maintenance operations.
- The lever mechanism is obtained from a double rod in rolled steel (single rod for DN 50/65) which, by means of stainless steel pivots, puts the shaft in communication with the float which imparts the movement allowing the opening or closing of the valve.
- A large float in stainless steel AISI 304 is connected to the above mentioned rods by means of a stainless steel pipe, onto which it exerts a vertical force.
- Thanks to the balanced single seat the valve will perform with high sensitivity, perfect water tightness even with low pressure values.
- The movements of the obturator during opening and closing are not affected by the incoming water pressure, meaning that transient effects are avoided.

Applications

- Water distribution systems.
- Fire protection storage tanks.
- Irrigation systems.
- Whenever the constant level regulation and control function is required.

Operating principle

Flanged to the incoming pipe, and driven by a large float in stainless steel, the valve automatically controls the water level inside the tank by cutting off the supply whenever it reaches the maximum level and reopens again as soon as it drops.

Open valve

As soon as the water level drops inside the tank the lever, to which the float is connected, will push down the mobile block to the open position allowing the water flow through the valve.

Closed valve

When the water level inside the tanks has reached the maximum level the float, thanks to the lever, will move up up the obturator closing the passage through the valve.

Optional

■ **Installation.** Athena has been designed with a three ways body, to allow both the installation as an angle and globe pattern level control valve, simply by placing the blind flange to the desired outlet.

■ **Anti freezing device.** On request the valve is provided with a 3/8" G threaded outlet, which can be used as an anti-freezing device, simply by replacing the tap with a drainage ball valve discharging directly into the tank.

During the winter season, when the temperature drops consistently, the partial opening of the drainage port will create a flow rate inside the valve avoiding frost and possible damages.

■ **Rod rotation.** The rod is normally aligned with the valve axis. It is possible to rotate it on site, with an angle of 45°/90°, to fit the installation requirements.

Technical data

Installation

- Make sure that the supply pipe has the flanges drilled according to the requested PN and that ATHENA is installed in a horizontal position, properly fixed and sustained.
- Gate valves and filters have to be installed to allow for maintenance operations, and to prevent dirt from reaching the internal components of the valve.
- Position the valve in a place which is easy to reach and wide enough for maintenance and control purposes.
- Observe the overflow level and make sure that the outlet flange is always above it, this is to avoid backflow.
- In case of excessive D_p , to avoid cavitation and possible damages to the valve, a direct acting pressure reducing valve CSA VRCD series should be installed.

Working conditions

Max temperature 70°C.
 Max pressure PN 16 (please contact us for higher values).
 To avoid cavitation the Max D_p across the valve should be limited to 8,5 bar for angle pattern, and 6,5 bar for globe pattern installations.

Standard

Designed in compliance with EN-1074/4.
 Flanges according to EN 1092/2.
 Epoxy painting applied through fluidized bed technology blue RAL 5005.
 Changes and variations on the flanges and painting details available on request.

Head loss coefficient for angle pattern

Kv coefficient representing the flow rate flowing through the valve fully open, and producing a head loss of 1 bar.

Head loss coefficient for globe pattern

Kv coefficient representing the flow rate flowing through the valve fully open, and producing a head loss of 1 bar.

Technical details

N.	Component	Material	Standard
1	Body	ductile cast iron	GJS 500-7
2	Cap	painted steel/stainless steel	Fe 37/AISI 304/316
3	Guiding bushing	bronze/steel/stainless steel	Fe 37/AISI 304/316
4	O-ring	NBR/EPDM	
5	Lip gasket	NBR/EPDM	
6	Seat	stainless steel	AISI 304/316
